14. An intraocular artificial lens according to claim 11, wherein the supporting arm is configured so as to run radially inside the penetration portion, relative to the lens body.

15. An intraocular artificial lens according to claim 11, wherein the starting arm of the anterior chamber portion is configured to have a curved shape and the supporting arm is configured to have a curved shape.

16. An intraocular artificial lens according to claim 12, wherein the second end portion of the supporting arm is configured to extend inwardly and is wider than a remainder of the supporting arm, an aperture being arranged in the second end portion.

17. An intraocular artificial lens according to claim 12, wherein the second end portion of the supporting arm has a circular arc configuration.

18. An intraocular artificial lens according to claim 1, wherein the anterior chamber portion has a support arm that extends from the penetration portion substantially in the direction of the posterior chamber portion, the anterior chamber portion further having a hook arm that extends from the penetration portion in a direction opposite the support arm, the support arm and the hook arm being arranged to lie in a common plane.

19. An intraocular artificial lens according to claim 1, wherein the anterior chamber portion includes a first support arm arranged to extend from the penetration portion and a second support arm arranged to extend from the penetration portion as a mirror image of the first support arm, the first and second support arms being configured to be displaceable in a single plane with the penetration portion so as to be passable through an iridectomy.

20. An intraocular artificial lens according to claim 1, wherein the anterior chamber portion includes at least one attachment arm arranged to extend above the penetration portion.

21. An intraocular artificial lens according to claim 20, wherein the at least one attachment arm is configured to run in a direction opposite to the posterior chamber portion.

22. An intraocular artificial lens according to claim 20, wherein the attachment arm is configured to run in a common direction with the posterior chamber portion.

23. An intraocular artificial lens according to claim 20, wherein at least one transverse arm is provided on the attachment arm above the penetration portion, the at least one transverse arm being configured so as to be essentially radially directed relative to the lens body.

24. An intraocular artificial lens according to claim 23, wherein two essentially identical transverse arms are provided on the attachment arm so as to run radially in opposite directions.

25. An intraocular artificial lens according to claim 20, wherein two attachment arms are provided so as to extend from the penetration portion in opposite directions so as to form a suspension that is substantially symmetrical to the penetration portion.

26. An intraocular artificial lens according to claim 1, wherein the anterior chamber portion is connected to the penetration portion by a radial part which extends substantially radially and parallel to the lens body.

27. An intraocular artificial lens according to claim 26, wherein the radial part extends radially outwardly relative to the lens body.

28. An intraocular artificial lens according to claim 1, wherein the posterior chamber portion is configured so that the support segment lies essentially in a plane parallel to the lens body, the second end of the posterior chamber portion being curved inwardly toward the lens body, the penetration portion extending substantially perpendicularly from the second end of the posterior portion.

29. An intraocular artificial lens according to claim 1, wherein the posterior chamber portion of the haptic fastener is connected to the lens body so as to be inclined at an angle of approximately 10° to the lens body plane.

30. An intraocular artificial lens according to claim 1, wherein the lens body and the at least one haptic fastener are formed as a single piece.

31. An intraocular artificial lens according to claim 1, wherein the at least one haptic fastener and the lens body are separate parts, the at least one haptic fastener and the lens body being bonded together.
